React Frontend Test – Incident Tracker

Build a simple React app where users can submit incident reports and view recent logs.

The form should include required fields like title, location, and severity (Low/Medium/High), along with optional fields like notes and name.

On submit, post the data to https://jsonplaceholder.typicode.com/posts, display a success message, clear the form, and also save the data to localStorage.

On app load, check localStorage for saved incidents; if none are found, fetch 5 sample logs from the same API and display them as a list of recent reports.

Use React functional components with useState and useEffect.
Avoid Redux and external libraries.
